Credit card

SRS

Introduction

1.1 Purpose of this document

The purpose of this document is to outline the requirements and specification for the development of a CCPS. It will provide a clear understanding of the project objectives, scope, functionalities and deliverables.

1.2 Scope of this document

This document defines the overall working and main objectives of the CCPS. It includes the major functional and non-functional requirments, system interface development constraints, estimated development time and project budget.

1.3 Overview

The credit CPS is software solution designed to securely process credit card transactions, including payment authorisation, transaction verification payment settlement, refunds, transaction tracking and reporting. The system will help merchants & financial institutions process card payments efficiently and securely.

1) General Description

The CCPS will cater to the minds of customers, merchants payments processors and administrators. It provides facilities for making and managing credit card payments.

Major features include:

- Credit card payment processing
- Transaction authorisation
- Transaction history management
- Refund and cancellation handling
- Fraud detection
- Payment status tracking
- Reports for administrators

2) Functional Requirements

3.1 Card Management

- The system should allow users to add and manage their credit card details.
- It should verify the card information before processing a payment.
- Invalid or expired cards should be rejected.

3.2 - Payment Processing

- Users should be able to make payments using a valid credit card.
- The system should check whether the transaction is authorised.
- After successful processing, the payment status should be updated

- A transaction record should be created for every payment

3.3- Transaction Management
- Maintain transaction records.
- Check and update payment status
- Record failed transactions.

3.4 - Refund Management
- Allow authorised users to request refunds.
- Maintain refund records.

3.5 - Fraud detection
- Detect saspicious transactions
- Flag or block unusual payments.

3.6 - Reporting
- Generate daily and monthly transaction reports.
- Allow administrators to monitor payments.

4) Non-functional requirements

4.1 Availability
- The system should be available whenever payments are required.

4.2 → Scalability
- The system should support increasing number of users and transactions.

4.3 → Performance
Payments should be processed quickly with minimum delay.

4.4 Security
Card and customer information must be protected from unauthorised access.

5) Data Integrity
Transaction records should remain accurate and consis

5) Design constraints
→ The system must follow payment security standard
→ It requires a reliable network connection.
→ It should work with existing payment gatewa

6) Hardware / Software requirements
Hardware - Server/cloud system, user computer or smartphone, network connection

Software → operating system, database, web ~~brow~~ server, payment gateway and ~~paym~~ web browser.

7) Preliminary ~~budge~~ schedule and budget -

The project is expected to take around 7 weeks including requirement analysis, design, develop testing and deployment. Estimated budget around ₹ 55000,

Activity	Duration
Requirement Analysis	1 week
System Design	1 week
Development	3 week
Testing	1 week
Deployment & Documentation	1 week
Total	7 weeks
